Faithfulness/relevancy marked (proxy) are lexical/embedding heuristics, not RAGAS; the LLM-judge values exist only when an LLM is configured.

Token counts are provider-reported when available, otherwise estimated at ~4 characters per token; cost uses MKA_PRICE_TABLE.

citation_accuracy = share of returned citations whose page/row exists and whose excerpt occurs there (checked by the Verification Agent); agent execution success = no internal error or timeout in any agent node.
